

## **Mini Storage Systems**

Mini Storage Complexes are very common using steel framing, steel siding and roofing. A variety of unit sizes can be mixed into one building. Building sizes are common in 20,30,40,50 foot widths. Many buildings are double slope gabled roof type, with units on both sides and ends of the building. Single slope is available for along the perimeter of your site or along a fence line. Common door sizes are 9×7, 8×7, and 3×7 or 4×7 for smaller units. Galvanized framing is available to help protect the structure.

Mini Storage complexes can be set up with several unit sizes to meet customer storage needs. Unit mixes can be 5×5, 5×10, 10×10, 10×15, and can be mixed in a complex or all the same size. Interior steel partitions separate units, and hallways can be added for interior access and climate controlled units. Climate controlled mini storage offer insulated walls, interior access, and heated units or hallways.
